How do solar panels work?

As we've explained, the solar cells that make up each solar panel do most of the heavy lifting. Through the photovoltaic effect, your solar panels produce a one-directional electrical current, called direct current (DC) electricity. Your home can't use DC electricity directly--it needs to be converted to alternating current (AC) electricity first.

How do solar panels generate electricity?

This process is constant. Over 500 million tons of hydrogen atoms are converted into helium every second, resulting in photons that generate solar energy here on Earth. In a nutshell, solar panels generate electricity when photons (those particles of sunlight we discussed before) hit solar cells. The process is called the photovoltaic effect.

How do solar panels convert sunlight into electricity?

The process of converting sunlight into usable electricity involves six key steps: When sunlight hits a solar panel, photons penetrate the anti-reflective coating and enter the silicon photovoltaic cells. Not all photons are absorbed--some reflect off the surface or pass through the material.

Do solar panels produce enough energy?

On cloudy days and during the night, a solar system may not produce enough energy to meet demand. The opposite is true for very sunny days: When energy use is low but production is high, panels will collect surplus energy, usually more than enough for a customer's energy needs.
