Wind turbine noise exposure and suspected health-related effects thereof have attracted substantial attention. Various symptoms such as sleep-related problems, headache, tinnitus and vertigo have ...

While wind turbines don't emit air pollutants during operation, they can generate noise pollution, particularly at close range. The whooshing sound of the blades rotating can be disruptive to ...

Large-scale wind turbines, which are relatively recent innovations, produce more sound when wind speeds are higher, which can mask the sound produced by the turbines. This paper ...

This paper discusses various noise generation mechanisms in wind turbines and potential noise reduction techniques. Special emphasis has been laid on reviewing aerodynamic noise ...

The main sources of sound pollution from wind turbines are aerodynamic sounds generated by the blades slicing through the air, mechanical sounds originating from the turbine's ...

Learn what causes noise from wind turbine blades, its health effects, regulations, and how low-noise models help to reduce noise pollution.

In this comprehensive guide, we explore the challenges of noise pollution from wind turbines, the methods used to measure and analyze sound levels, and the technological innovations that are ...

Operating wind turbines can create several types of sounds, including a mechanical hum produced by the generator and a "whooshing" noise produced by the blades moving through the air.

This paper discusses various noise generation mechanisms in wind turbines and potential noise reduction techniques. Special emphasis has been laid on reviewing aerodynamic noise sources...

Noise pollution from wind power generation
