What are the dimensions of the energy-storage cabin?

The dimension selected for the energy-storage cabin is 5.89 m x 2.35 m x 2.39 m. The battery cells are based on the CATL 100AH LiFePO₄ battery, and the final model dimension of the lithium-ion batteries is 280 mm x 280 mm x 160 mm. Given the substantial weight of the lithium-ion batteries, a 2 mm medium-duty shelving layer is chosen.

Does air vent C affect smoke gas concentration?

Comparing the cloud diagrams from the experiments revealed that smoke gas concentrations around the batteries and inside the energy-storage cabin are significantly lower when ventilation opening Vent c is aligned with the door compared to other positions. Moreover, peak smoke gas concentrations occur much earlier under these conditions. Fig. 15.

Should energy storage warehouse doors be closed?

Additionally, the energy storage warehouse door should remain normally closed to ensure that, in the event of a fire requiring external rescue, the door does not open too widely, as this could exacerbate the fire situation. It is advisable to only open it slightly to allow firefighters to carry out their rescue operations effectively. 5.

Conclusion

How does a ventilation vent affect cabin temperature?

When the ventilation vent is located closer to the batteries, cabin temperatures reach higher peaks and smoke concentrations peak earlier. Effective smoke circulation between the ventilation port and the door further enhances cabin temperature peaks and significantly advances the time when smoke concentrations reach their maximum.
