We developed a mixed integer programming model to provide the optimal location of base stations at different time periods with the network's minimum total cost (i.e., installation and operation ...

Based on the above analysis, the selection of base stations needs to consider the layout mode to reduce the distance and variance between base stations, while the relative position between the target and ...

In the actual construction process, we adopt effective site selection, which can not only improve the investment efficiency, but also reduce the construction and maintenance cost of base station.

This fully demonstrates that the adopted algorithm perfectly avoids interference issues between base stations during site selection, ensuring the rationality and stability of base station ...

In order to minimize the cost of establishing base stations while covering a large amount of services, this paper uses objective planning and establishes a mathematical model to solve the optimal ...

The major problem in achieving ideal signaling between mobile phones and base stations is inaccurate site selection due to the altitude of the region. In addition to altitude, there are many important ...

The primary mission of a base dictates the initial requirements. Is this all you consider when developing your requirements? Why? No, you must consider all present and planned missions

Based on the principle of priority business volume and the cost performance of base station, this paper establishes a set of models to solve the site selection planning problem of urban base station.

In this paper, to address the site planning and area clustering problems of mobile communication networks, the K-mean clustering algorithm, linear programming,

The principles of base station site selection do not include

Therefore, when selecting a site, we must consider both coverage requirements and interference with adjacent base stations and adjacent systems; and in mobile communication networks, we should not ...
